

ATMOSPHERIC HEIGHT FOG

GET STARTED

GLOBAL SETUP

- To add **Atmospheric Height Fog** to your scene, go to **GameObject menu > BOXOPHOBIC > Atmospheric Height Fog > Global**. A new Height Fog Global gameobject will be created and the fog will appear in your scene. Assign the Main Camera and Main Directional light if they were not assigned automatically by the script (if not found)
- The fog settings can be controlled in 3 ways:
 - Use Script settings
 - Use preset materials to easily reuse the same settings across different scenes. The preset material needs to use the **BOXOPHOBIC > Atmospheric > Preset** shader. It has the same parameters as the script.
 - Interpolate between 2 presets for a day-night transition. The transition is a simple slider controllable by the user.

Please keep in mind that you might need to update the **Fog Height Start** and **Fog Height End** values to match your scene if your scene is not positioned at 0. The following values are in world space and world units!

VOLUME SETUP

- To add an **Override volume** to your scene, go to **GameObject menu > BOXOPHOBIC > Atmospheric Height Fog > Override Volume (Box)** or **Override Volume (Sphere)**. A new Height Fog Override gameobject will be created in your scene. When the Camera is entering this volume, the fog global setting will be overridden by the Height Fog Override settings. You can set the transition effect by using the Volume Distance Fade value.
- This is useful to change fog settings when entering a dark forest or changing the fog settings underwater for example.
- The override script has the same settings as the Global script and presets, or time of day can be used as well.

STANDALONE SETUP

The Global Fog script is not required to add fog to your scene. Atmospheric Height Fog includes a standalone shader usable on VR Chat and SineSpace where scripts are not supported, or to bypass the script usage altogether. To use the standalone fog, follow the steps.

Please note that the depth texture needs to be enabled on the camera or the deferred camera needs to be used for the fog to work! See below!

- Create a sphere and attach it to your camera
- Create a material and choose the BOXOPHOBIC/Atmospherics/Height Fog Standalone shader
- Set the material Render Queue to 3001 to render over the other transparent materials
- Assign the material to the sphere. That's it!

CAMERA DEPTH TEXTURE

When using the standalone shader, the depth texture needs to be enabled on the camera. Based on the render pipeline used, you need to create a new script to enable the depth in Forward path, use deferred rendering or any effect that enabled the depth, or enable the depth on the camera in URP or URP asset.

In **Universal Render Pipeline**, you can simply enable the Depth Texture on the camera:

In **Standard Render Pipeline**, you can use the following script attached to the camera if the depth texture is not already enabled:

```
using UnityEngine;

[ExecuteInEditMode]
public class EnableCameraDepth : MonoBehaviour
{
    void Start()
    {
        gameObject.GetComponent<Camera>().depthTextureMode = DepthTextureMode.Depth;
    }
}
```

SHADER OPTIMIZATIONS

There are 4 quick optimizations you can make if the fog is used for VR or Mobile:

- Disable Noise calculations
- Disable Directional calculations
- Disable Skybox fog if the fog is already added to the skybox
- Disable Falloff which will disable all Power calculations which might be expensive on mobile or VR

To reduce the number of global keywords and variants created by the shader compiler, the shader uses defines instead. You can find them in the BOXOPHOBIC/Atmospheric Height Fog/Core/Resources/Height Fog Global.shader. Simply comment out the following defines to disable the features:

```
//Disable shader features
#define AHF_DISABLE_NOISE3D
#define AHF_DISABLE_DIRECTIONAL
#define AHF_DISABLE_SKYBOXFOG
#define AHF_DISABLE_FALLOFF
```

Keep in mind that if you disable the features on the Global Fog shader, you might want to do the same for transparent shaders which have the fog integrated:

```
#include "Includes/LuxWater_Utils.cginc"
#include "Includes/LuxWater_GerstnerWaves.cginc"
#include "Lighting.cginc"
#include "Assets/BOXOPHOBIC/Atmospheric Height Fog/Core/Includes/AtmosphericHeightFog.cginc"

//Disable the directional featue
#define AHF_DISABLE_DIRECTIONAL
```

ASSEMBLIES

You can use Assembly Definitions to organize the scripts in your Project into assemblies. When you create an Assembly Definition Asset in a folder, Unity compiles a separately managed assembly from all the scripts in that folder. Scripts in subfolders are included unless the subfolder has its own Assembly Definition. These managed assemblies act as a single library within your Unity Project.

If you reference any Boxophobic script and your project also uses Assembly Definitions, make sure you add all the dependencies. If you don't want any Assembly Definitions in your project, you can delete them and wait for unity to recompile all the scripts. If you have errors after compiling, restart Unity so the assemblies are refreshed. All Boxophobic assets include four Assembly Definitions listed below.

Read more about Assembly Definitions and check out the Boxophobic asmdef files:

- [Assembly Definitions Overview](#)
- **Boxophobic.AtmosphericHeightFog.Editor.asmdef**
- **Boxophobic.AtmosphericHeightFog.Runtime.asmdef**
- **Boxophobic.Utils.Editor.asmdef**
- **Boxophobic.Utils.Scripts.asmdef**

INTEGRATION

CREST OCEAN FOR STANDARD RP

Crest Ocean by **Wave Harmonic** is a technically advanced, feature-rich ocean system targeted at PC and console platforms and Standard RP.

- To add integration with Atmospheric Height Fog, open Ocean.shader file, find the blue lines and add the yellow code, then save the shader.
- Set the water material Render Queue to 3002+ to be rendered over the fog

```
Cull [_CullMode]
Stencil
{
    Ref 222
    Comp Always
    Pass Replace
}
...

#include "Lighting.cginc"
#include "Assets/BOXOPHOBIK/Atmospheric Height Fog/Core/Includes/AtmosphericHeightFog.cginc"

...

if (!underwater)
{
    //UNITY_APPLY_FOG(input.fogCoord, col);
    float4 fogParams = GetAtmosphericHeightFog(input.worldPos.xyz);
    col.rgb = ApplyAtmosphericHeightFog(col.rgb, fogParams);
}
```

CREST OCEAN FOR URP

Crest Ocean by **Wave Harmonic** is a technically advanced, feature-rich ocean system targeted at PC and console platforms and Universal RP.

- To add integration with Atmospheric Height Fog, open Ocean.shader file, find the blue lines and add the yellow code, then save the shader.
- Set the water material Render Queue to 3002+ to be rendered over the fog

```
Cull [_CullMode]
Stencil
{
    Ref 222
    Comp Always
    Pass Replace
}

...

#include "Packages/com.unity.render-pipelines.universal/ShaderLibrary/Lighting.hlsl"
#include "Assets/BOXOPHOBIC/Atmospheric Height Fog/Core/Includes/AtmosphericHeightFog.cginc"

...

if (!underwater)
{
    col = MixFog(col, input.positionWS_fogFactor.w);
    float4 fogParams = GetAtmosphericHeightFog(input.positionWS_fogFactor.xyz);
    col.rgb = ApplyAtmosphericHeightFog(col.rgb, fogParams);
}
```

CREST OCEAN FOR HDRP

Crest Ocean by **Wave Harmonic** is a technically advanced, feature-rich ocean system targeted at PC and console platforms for URP and HDRP.

- To add integration with Atmospheric Height Fog, open the Ocean shader file in Shader Graph and add the Apply Height Fog PBR subgraph node as seen in the image below.
- Set the water material Render Queue to 3002+ to be rendered over the fog

R.A.M 2019 FOR UNIVERSAL RP

R.A.M 2019 by **NatureManufacture** gives you the ability to create a very advanced river and lakes with flow map, river bed shapes with advanced shading automatically.

- To add integration with Atmospheric Height Fog, open the **water shader** file, find the blue lines and add the yellow code, then save the shader. Please note that because RAM uses PBR shading, proper fog support cannot be added because the water will still be lit!
- Set the Water material **Render Queue** to **3002** or higher so the water is rendered on top of the global fog sphere. Please note that the Global Fog render queue can be set using the Render Priority setting.

```
#include "Packages/com.unity.shadergraph/ShaderGraphLibrary/ShaderVariablesFunctions.hlsl"
#include "Assets/BOXOPHOBIC/Atmospheric Height Fog/Core/Includes/AtmosphericHeightFog.cginc"

...

float4 fogParams = GetAtmosphericHeightFog(IN.AbsoluteWorldSpacePosition);
surface.Albedo = _Lerp_96C773B7_Out_3;
//surface.Alpha = _Branch_6D78BA69_Out_3;
surface.Alpha = (1- fogParams.a) * surface.Alpha;
```

LUX WATER FOR STANDARD RP

Lux Water by **Forst** is a simple yet robust solution to render water surfaces, which is focused on giving you reliable results as far as refraction, reflection and lighting are concerned. To add integration with Atmospheric Height Fog, follow the tutorial below:

- Set the Water material Render Queue to a higher value (3002+) than the Global Fog material render queue so the water is rendered on top of the global fog sphere. Please note that the Global Fog render queue can be set using the Render Priority setting.
- Open the LuxWater/Shaders/Includes/LuxWater_Core.cginc file, find the blue lines and add the yellow code:

```
#include "Includes/LuxWater_Utils.cginc"
#include "Includes/LuxWater_GerstnerWaves.cginc"
#include "Lighting.cginc"
#include "Assets/BOXOPHOBIC/Atmospheric Height Fog/Core/Includes/AtmosphericHeightFog.cginc"

...

// Add this only if you want to disable the fog on the back side of the water
if (!backside)
{
    float4 fogParams = GetAtmosphericHeightFog(worldPos.xyz);
    c.rgb = ApplyAtmosphericHeightFog(c.rgb, fogParams);
}

//Smooth water edges
c.rgb = lerp(OrigRefraction, c.rgb, edgeBlendFactor);
```

LUX WATER FOR URP

Lux Water by **Forst** from the Essentials URP package is a simple yet robust solution to render water surfaces. To add integration with Atmospheric Height Fog, follow the tutorial below:

- Set the Water material Render Queue to a higher value (3002+) than the Global Fog material render queue so the water is rendered on top of the global fog sphere. Please note that the Global Fog render queue can be set using the Render Priority setting.
- Open the LuxWater shader file, find the blue lines and add the yellow code:

```
#include "Packages/com.unity.render-pipelines.universal/ShaderLibrary/Lighting.hlsl"
#include "Packages/com.unity.render-pipelines.core/ShaderLibrary/Color.hlsl"
#include "Packages/com.unity.render-pipelines.core/ShaderLibrary/UnityInstancing.hlsl"
#include "Assets/BOXOPHOBIC/Atmospheric Height Fog/Core/Includes/AtmosphericHeightFog.cginc"

...

//color.rgb = shad;
//color.rgb = refractedSceneDepth;
//color.rgb = surfaceEyeDepth;
//color.rgb = viewDepth;

float4 fogParams = GetAtmosphericHeightFog(input.positionWS.xyz);
color.rgb = ApplyAtmosphericHeightFog(color.rgb, fogParams);

return color;
```

STYLIZED WATER FOR URP (SHADER GRAPH)

Stylized Water For URP by **Alexander Ameye** is a feature-rich, easy-to-customize, gorgeous stylized water system, built for the Universal Render Pipeline.

- To add integration with Atmospheric Height Fog, find the **Apply Height Fog.shadersubgraph** from the BOXOPHOBIC > Atmospheric Height Fog > Core > Functions folder and drag it to the **Fog.shadersubgraph** from the Stylized Water For URP/Shaders/Libraries/Surface and Lighting folder. Connect them as shown in the image below. Save the Fog subgraph.
- If needed, set the Water material render queue higher than the Global Fog material render queue so the water is rendered on top of the global fog sphere. Please note that the Stylized Water components can be set to visible by unchecking the Hide Components toggle under the Advanced Settings. The Global Fog render queue can be set using the Render Priority setting.

STYLIZED WATER SHADER (AMPLIFY SETUP)

Stylized Water Shader by **Staggart Creations** is a set of highly customizable stylized water suite, designed for artistic freedom, rather than a realistic water simulation.

- To add integration with Atmospheric Height Fog using Amplify Shader Editor, all you need to do is to add the Apply Height Fog function found in the BOXOPHOBIC > Atmospheric Height Fog> Core > Functions folder to the Water shaders as shown in the image from below:
- Set the Water material render queue to a higher value than the Global Fog material render queue so the water is rendered on top of the global fog sphere. Please note that the Global Fog render queue can be set using the Render Priority setting.

STYLIZED WATER SHADER (MANUAL SETUP)

Stylized Water Shader by **Staggart Creations** is a set of highly customizable stylized water suite designed for artistic freedom, rather than a realistic water simulation.

- To add integration with Atmospheric Height Fog without Amplify Shader Editor, open water shaders, find the blue lines and add the yellow code, then save the shader:
- Set the Water material render queue to a higher value than the Global Fog material render queue so the water is rendered on top of the global fog sphere. Please note that the Global Fog render queue can be set using the Render Priority setting.

```
#include "lighting.hlsl"
#include "Assets/BOXOPHOBIC/Atmospheric Height Fog/Core/Includes/AtmosphericHeightFog.cginc"

...

c.rgb = staticSwitch857.rgb;
c.a = OpacityFinal814;
float4 fogParams = GetAtmosphericHeightFog(i.worldPos);
c.rgb = ApplyAtmosphericHeightFog(c.rgb, fogParams);
```

COMPONENTS

HEIGHT FOG HUB

The Height Fog Hub will let you choose the Render Pipeline for the fog. To access it go to Window > BOXOPHOBIC > Atmospheric Height Fog > Hub.

Settings

- **Render Pipeline**
 - Standard - Imports Standard RP compatible shaders and assets
 - Universal - Imports Universal RP compatible shaders and assets
 - High Definition - Imports HDRP compatible shaders and assets

HEIGHT FOG GLOBAL / OVERRIDE

The Height Fog Global component is the main script that needs to be attached to an empty gameobject in order to activate the fog in the scene. See the explained Height Fog Settings below.

Settings

- **Scene Settings**
 - Main Camera - Choose a new camera to override the default one
 - Main Directional - Choose a new directional light to override the default one
- **Preset Settings**
 - Use Script Settings - Use the script settings
 - Use Preset Settings - Use a preset for the fog
 - Use Time Of Day - Works by interpolating two Fog Preset materials using the BOXOPHOBIC > Atmospherics > Fog Preset shader
- **Fog**
 - Fog Intensity - Overall fog intensity
 - Fog Axis Mode - Choose the height axis
 - X Axis
 - Y Axis
 - Z Axis
 - Fog Layers Mode - Choose the fog layers blending mode
 - Multiply Distance And Height
 - Additive Distance And Height
 - Fog Camera Mode - Choose the camera projection mode
 - Perspective
 - Orthographic
 - Both
 - Fog Color Start - Start fog color
 - Fog Color End - End fog color
 - Fog Color Duo - End fog color influence

- Fog Distance Start - The distance in world units where the fog begins
- Fog Distance End - The distance in world units where the fog is at full intensity
- Fog Distance Falloff - Mask raised to the power of the falloff

- Fog Height Start - The height in world units where the fog is at full intensity
- Fog Height End - The height in world units where the fog fades
- Fog Height Falloff - Mask raised to the power of the falloff

- Far Distance Height - Add custom height in distance
- Far Distance Offset - Offset the Distance End value where the custom Far Height begins

- **Skybox**

- Skybox Fog Intensity - The overall skybox fog intensity
- Skybox Fog Height - The height of the fog on the skybox
- Skybox Fog Falloff - Mask raised to the power of the falloff
- Skybox Fog Offset - Offset the horizon line
- Skybox Fog Bottom - Fill the skybox with fog below the horizon line
- Skybox Fog Fill - Fill the skybox with fog above the horizon line

- **Directional**

- Directional Intensity - The overall directional color intensity
- Directional Falloff - Mask raised to the power of the falloff
- Directional Color - The fog color based on the directional light direction

- **Noise**

- Noise Intensity - The overall intensity of the noise
- Noise Min/Max - Remap the noise mask between the min and max values
- Noise Scale - The scale of the noise
- Noise Speed - The speed of the noise animation in XYZ space

- Noise Distance End - The distance in world units where the noise fades

APPLY HEIGHT FOG for AMPLIFY

The Apply Height Fog function can be used to apply fog on transparent shaders made with Amplify Shader Editor. It can be used in Surface shaders or Vertex Fragment shaders. The fog is automatically disabled in shaders if the Height Fog Global gameobject is disabled.

Find the function under BOXOPHOBIC > Atmospheric Height Fog > Core > Functions.

- **Surface Shaders** - When using Surface Shaders or Universal PBR template, connect the function to the Emission port. If Emission is used, pass the emission color through the Apply Height Fog node.
- **Fragment Shaders** - When Unlit or custom UI shaders are used, pass the final color through the Apply Height Fog node.

APPLY HEIGHT FOG for SHADER GRAPH UNLIT

The Apply Height Fog sub shader graph can be used to apply fog on transparent shaders made with Unity's Shader Graph. The fog is automatically disabled in shaders if the Height Fog Global gameobject is disabled.

Find the function under BOXOPHOBIC > Atmospheric Height Fog > Core > Functions.

- The Apply Height Fog subgraph has a color input where your output color needs to be plugged.

ATMOSPHERIC HEIGHT FOG INCLUDE

The AtmosphereHeightFog.cginc file contains functions to apply the height fog on custom transparent shaders.

- Add the following directives to your shader pass:

```
#include "Assets/BOXOPHOBIC/Atmospheric Height Fog/Core/Includes/AtmosphericHeightFog.cginc"
```

- Apply Atmospheric Height Fog to transparent shaders like in this example, where finalColor is the shader output color, fogParams.rgb is the fog color and fogParams.a is the fog mask:

```
float4 frag (v2f i ) : SV_Target
{
    UNITY_SETUP_INSTANCE_ID(i);
    UNITY_SETUP_STEREO_EYE_INDEX_POST_VERTEX(i);

    //Calculate world position in fragment
    //float3 worldPosition = mul( unity_ObjectToWorld, float4( v.vertex.xyz , 0.0 ) ).xyz;

    //Get world position from vertex shader
    float3 worldPosition = i.worldPos;

    float4 finalColor = float4(1, 1, 1, 1);

    float4 fogParams = GetAtmosphericHeightFog(worldPosition);
    return ApplyAtmosphericHeightFog(finalColor, fogParams);
}
```

UI DEFAULT SHADER

Version 1.3.0 includes a UI Default shader clone with Height Fog support for World Space Canvases. The shader is UI > Default (Height Fog Support).

One thing to note here, transparent objects have the Render Queue set to 3000, Height Fog Global to 3001 to be rendered over them and objects that have fog applied in the shader via the **Apply Height Fog** function need to have the Render Queue set at 3002 or higher in the material inspector.

For Universal Render Pipeline, the Transparent Render Queue is 3100, the Fog is rendered at 3101 and the objects that have the fog applied in shader directly, the Render Queue needs to be set at 3102 or higher.

VERIFIED

STANDARD RENDER PIPELINE

- Windows - **Working**
- Android - **Working**
- VR Windows **Mock HMD MultiPass** - **Working**
- VR Windows **Mock HMD SinglePass Instanced** - **Working**
- VR Android **Google Cardboard MultiPass** - **Working**
- VR Android **Google Cardboard SinglePass** - **Working**
- VR Android **Oculus Go MultiPass** - **Working**
- VR Android **Oculus Go SinglePass** - **Working** (minor issues with skybox mask)
- VR Android **Oculus Quest MultiPass** - **Working**
- VR Android **Oculus Quest MultiView** - **Not Working** (issue with right eye depth rendering, Unity bug)

UNIVERSAL RENDER PIPELINE

All tests are done in Unity 2020.3 LTS + URP 10.5.0 + AHF 2.0.0 + XR Plugin Manager

- Windows - **Working**
- Android - **Working**
- VR Windows **Oculus MultiPass (Oculus Link)** - **Working**
- VR Windows **Oculus SinglePass Instanced (Oculus Link)** - **Working**
- VR Android **Oculus Quest MultiPass OpenGL** - **Working**
- VR Android **Oculus Quest MultiView OpenGL** - **Working**
- VR Android **Oculus Quest MultiPass Vulkan** - **Working**
- VR Android **Oculus Quest MultiView Vulkan** - **Working**

Due to the immense number of URP versions, many of them with broken depth buffer or various issues based on the URP asset features enabled, URP 7x and URP 8x is not tested in VR!

HD RENDER PIPELINE

Tests done in **Unity 2019.4 LTS / 2020.1 / 2020.2**

- Windows - **Verified**

CHANGELOG

IMPORTANT

- Always delete the Asset and Utils folders before importing a new version to avoid issues with renamed assets! Using the latest version is always recommended!

3.2.0

Features

- Core: Added automatic pipeline selection
- Core: Improved Shader Graph support for transparent shaders using PBR lighting (better integration with assets like Crest or other SG water assets)

3.1.0

Features

- Core: Added Far fog options to add height fog on distant landscapes
- Core: Added Apply Height Fog PBR for both Amplify Shader Editor and Shader Graph to be used with PBR transparent shaders

3.0.0

Changes

- Core: Unity 2021.3+ is now the minimum required version
- Core: Changed the distance fog falloff behavior, the fog might slightly change

Features

- Shaders: Added Jittering support to avoid color bending
- Shaders: Added Orthographic support in all render pipelines
- Utils: Updated and improved common BOXOPHOBIC scripts

2.3.0

Utils

- Updated and improved common BOXOPHOBIC scripts
- Removed some editor related icons from the build

2.0.0

New

- Shaders: Added new package for URP 10+ and Oculus Quest

2.1.0

New

- Shaders: Added option to offset the Skybox Fog position

2.0.0

New

- The minimum required versions are now Unity 2019.4.0 LTS / SRP 7.4.3!
- Core: Autorun Hub on asset import and save current pipeline used

1.9.0

New

- Shaders: Added HDRP 7.4.1 - 10.2.2 support
- Shaders: Added Standalone fog shader usable without scripts on VRChat or SineSpace

Improvements

- Shaders: Optimized the 3D Noise (50% less shader instructions usage)
- Shaders: Removed global keywords usage!
- Shaders: Improved shader GUI

- Shaders: Added hidden define keywords to disable the noise and directional support if needed:
 - AHF_DISABLE_NOISE3D
 - AHF_DISABLE_DIRECTIONAL
- Core: Updated Utils to 3.2.2

Changes

- Core: The minimum required Unity versions is 2019.1
- Core: Height Fog per Object is now deprecated (still available in the Legacy folder)
- Shader: The noise is now optimized and always on

1.8.1

Features

- Core: Added option to create Spherical or Box overrides
- Core: Added option to manually set the fog sphere position and scale

Improvements

- Core: Hide fog properties when Preset or Time Of Day modes are used
- Core: Colored override volumes based on the volume color
- Core: Renamed Packages and Library to avoid Git issues
- Core: Updated Utils to 3.2.0

Fixes

- Core: Directional not working with Preset or Time Of Day modes
- Shaders: Missing HDR for directional color on preset materials

1.8.0

- Added - Core: AtmosphericHeightFog namespace to avoid enums with the same name from other assets
- Added - Core: Simple preset mode support
- Added - Core: Universal Render Pipeline 7.4.1+ for WebGL
- Added - Shaders: ShaderGraph Apply Height Fog subgraph
- Added - Shaders: Skybox Fog Intensity

- Added - Shaders: Additive Distance and Height support
- Added - Shaders: Support for Stencil masking
- Improved - Core: If DepthNormals is enabled, the fog will not override this option on the camera
- Improved - Core: The Render Priority is now an int filed instead of a range
- Improved - Core: Add a generic pink fog when the presets are not assigned
- Improved - Shaders: Removed 2 global keywords (AHF_DIRECTIONALMODE_OFF and AHF_DIRECTIONALMODE_ON)
- Improved - Shaders: Removed multiple Unity CG includes

1.7.0

- Added - Core: Basic Time Of Day via Day-Night material interpolation
- Added - Shaders: Fog Color Start and Fog Color End
- Added - Shaders: Falloff for Fog Distance, Fog Height, Skybox Fog, Directional
- Added - Shaders: Custom Light as Directional Light support
- Added - Shaders: AtmosphericHeightFog.cginc for custom shaders fog integration
- Added - Core: Assembly Definitions for faster compilation
- Added - Core: Windows menu links for fast access
- Improved - Shaders: Removed 2 global keyword
- Fixed - Core: Disable Override on GameObject disable and destroy
- Changed - Deprecated Presets support
- Changed - The minimum required version is now 2018.4

1.6.0

- Added - Universal Render Pipeline 7.4.1/8.1.0 support

1.5.1

- Fixed - Depth rendering broken in some cases
- Fixed - Fog not updating in realtime

1.5.0

- Added - Core Utils 2.0.0
- Added - Fog Axis selection
- Added - Fog Color / Fog Alpha outputs for the Apply Height Fog function
- Added - Global Volume and Override Volume creation from GameObject menu

1.4.0

- Added - Latest Utils version
- Fixed - URP depth with HDR enabled
- Changed - Requires Unity 2018.3+
- Deprecated - LWRP is no longer supported

1.3.0

- Added - Apply Height Fog Amplify function, used to add fog support for transparent shaders made with Amplify Shader Editor
- Added - UI Default shader with Height Fog support, when the UI is used in World Space Canvas

1.2.0

- Added - Universal Render Pipeline support

1.1.0

- Added - Hub support for Add-ons
- Added - Amplify Shader Editor fog functions

1.0.0

- Added - Fog Presets
- Added - Per Object Transparency support (Experimental, will work for most unity built-in transparent shaders or custom shaders via the Custom Fog Material support)
- Improved - VR support for Standard RP
- Fixed - Depth precision on mobile devices

0.9.0

- Added - Fog Override Volumes
- Added - VR Support (tested with MultiPass and SinglePass Instanced Multiview on Android with Standard RP and Lightweight RP)
- Added - Orthographic Support
- Improved - Post Processing performance
- Deprecated - Height Fog for Post Processing Stack 2 will be removed soon
